

## ABSTRACT OF THE DISCLOSURE

### **SYSTEM AND METHOD FOR EVALUATING MOVING QUERIES OVER MOVING OBJECTS**

The present invention is directed to a system and a method for evaluating a  
5 plurality of moving queries over moving objects. The method, which can be embodied in  
a computer readable medium containing computer readable code, constructs motion-  
adaptive bounding boxes around the objects and queries and indexes the objects and  
queries based upon the bounding boxes. Predictive query results are used to optimize the  
evaluation of the moving queries. The bounding boxes vary in size and shape depending  
10 on the speed and motion direction of the objects and queries. The system of the present  
invention includes the moving objects and queries, each having an associated motion-  
adaptive bounding box. The system also provides for a monitoring system capable of  
monitoring the location and motion of the moving objects and moving queries and of  
evaluating the moving queries. The monitoring system includes a motion-adaptive query  
15 index and a motion-adaptive object index.
